Scientists from Hvar Observatory (Croatia), the University of Graz (Austria), and Skoltech (Russia) along with their colleagues from the U.S., Belgium, and China have investigated a peculiar solar storm that happened on the International Women's Day 2019. The all-female research team unraveled how a double structure erupted from the Sun, resulting in a plethora of phenomena observed across the electromagnetic spectrum, eventually merging into a single structure that sped toward the Earth. Published in *Astronomy & Astrophysics*, the [study](#) contributes to accurate predictions of hostile space weather events.
